

Artificial Intelligence

Artificial Intelligence (AI) refers to the ability of machines to perform tasks that typically require human intelligence, such as reasoning, learning, problem-solving, and understanding language. Modern AI systems, powered by techniques like machine learning and deep learning, are trained on large amounts of data to recognize patterns and make predictions or decisions. From voice assistants and recommendation systems to self-driving cars and medical diagnostics, AI is increasingly woven into everyday life. As the technology advances, it continues to raise important questions about ethics, safety, and the changing nature of work, making thoughtful and responsible development essential.
